

Lodestar demo flow

About 12 minutes · lead with MR, then CT, close on ultrasound · figures from 29 Sep 2026: read the live values off the screen on the day

Before the meeting

The day before: refresh the backup snapshot (docs/runbooks/refresh-snapshot.md).

15 minutes ahead, in the browser you'll present from:

- ☐ Password for the site: in Vercel env **LODESTAR_SITE_PASSWORD** (asked once per browser, remembered 30 days).
- ☐ Open the four links below as separate tabs, in order, and leave them for a minute.
- ☐ In each tab, collapse the **Layers** panel (click its header) so it doesn't cover the Americas.
- ☐ Bottom of **Hotspots worth diving into** reads "8/8 live feeds". A GDELT news-pulse note is expected: just don't mention news spikes.
- ☐ **Command brief** shows a headline and decisions. The ultrasound tab should say "No decisions".
- ☐ Close any tab with the old prototype open.

1. All

Opening

~45 seconds

"Thanks for the time. What you're about to see is Lodestar, a working prototype of a supply-chain command centre for medical imaging.

It answers one question every morning: what is happening in the world right now that could stop us building, shipping or installing a system, and what should we decide about it today?

Everything outside the company's walls is real public data: shipping transits, export controls, earthquakes, travel advisories, FDA notices. Each item is time-stamped and linked to its source. Everything inside the walls (stock cover, installs, revenue) is synthetic for now, and it's labelled that way on every screen.

The AI reads the evidence and recommends. People decide.

I'll show you two product lines where the picture is most interesting today, MR and CT, and then one where it's calm."

1. All product lines

1 minute · tab 1

- **Glow** = exposure. Only scores of 35+ glow; the number on a marker is its score.
- **Lines** = the company's lanes. Sea lanes follow real routes through the chokepoints; air lanes are arcs.
- **Ports** are labelled. Charleston has three lanes: UK, Gulf, Brazil.
- **Hover Strait of Hormuz:**

"About [figure on the tooltip] ships a day this past week. In 2025 this strait averaged about 85 a day."

- **Command brief:** revenue at risk (~\$364M) is **synthetic**. The brief is AI-written from the evidence, with model and cost shown.

"The model recommends; people decide."

2. MR

4 minutes · tab 2

- **Board:** conventional magnet 70, sealed low-helium magnet 8.

"The sealed magnet uses under 1% of the helium. That's the hedge, and you can see it."

- **Hotspots:** Hormuz 60 · Qatar helium 57 · Russian helium 43.

Click Strait of Hormuz → Open evidence drawer, and walk down it

1. **The AI's read:** headline and three sentences written from the evidence below.
2. **Chatter:** Telegram posts, labelled unverified and never scored.
3. **Why this was flagged:** live PortWatch count, war-risk rating (our own dated setting), synthetic stock cover.
4. **How it reaches us:** two company lanes through Hormuz → helium → plants → products → installs.
5. **Survive vs recover:** 41 days of stock vs 120 to recover (synthetic). Move the what-if slider from 2 to 3 months: installs short 24 → 61; revenue at risk \$54M → \$137M.
6. **What we can do:** the brief's recommended action and decide-by date.

Under "Have the agent draft it" → S&OP escalation

- Point at "needs your approval · nothing has been sent". **Approve & route** sends nothing.

3. CT

3 minutes · tab 3

- **Board:** CT 69, also hit by Hormuz via the Beijing → Gulf lane. Photon-counting CT 39 (tungsten).
- **Input clock:** tungsten exposed (75 days of stock vs 150 to recover); gadolinium covered (60 vs 45).

"Both are under China's controls. Only one is a problem, because the stock cover differs."

- **Open the Gadolinium drawer:** China's October 2025 expansion is suspended until about 10 Nov 2026.

"That's the date to watch."

- **Regulatory & trade watch:** FDA recalls and clearances (incl. CT), export controls tagged sourced or estimate.
- **Optional:** Bayan Obo, the world's largest rare-earth mine, sits north of the Baotou gadolinium source.

4. Ultrasound

30 seconds · tab 4

Scores 8, \$0 and no installs at risk. The brief calls it a calm day and makes no decisions.

"It also tells you what not to worry about."

5. Closing line

"Everything outside the company's walls comes from public feeds, time-stamped and refreshed every few hours. Connect ERP, the install backlog and the supplier master, and the synthetic numbers become real."

Don't

- Say "real-time" or "live AIS" (transit counts are daily and a couple of days behind).
- Present synthetic numbers as company data.
- Claim price signals for memory chips or rare earths.
- Promise Federal Register items, or treat Telegram posts as fact.
- Name the client.
- Dwell on the Charleston → Gulf or Haifa → Germany lanes (routes not yet confirmed).

If the site is down: use the static prototype at lodestar-prototype.vercel.app. Sources for the talking points: IMF PortWatch (Hormuz 85.5 transits/day in 2025); helium controls, Russia 14 Apr 2026 and China 10 Jul 2026 (see docs/DEMO_SCRIPT.md).
